

Test	Previous Plan	This plan	Change	Priority	
Power endurance	90 sec (@ 51.3 kg)	190 sec (@ 56 kg)	111% ↑ +7kg / 22mg	High to Low	24/5/24 +7kg 22mg
2 Rep Max Pull-up	66.5 kg (134% BM)	59.6 kg (120% BM)	-10% ↓	Low to Mod	12kg
Hip flexibility (heel to heel)	155 cm (101% height)	154 cm (100% height)	-1% ↓	Low to Low	160cm

Finger strength

Your most recent score of 93.6 kg - 189 % body mass (Beastmaker 2000 with 22mm edge) - on the 2 arm maximum hang test is above the expected finger strength for a climber of your current route climbing grade and/or bouldering grade.

When we compare this score with your previous score of 85.5 kg - 173 % body mass (Beastmaker 1000 with 22mm edge) we can see that your finger strength score has increased by 9% since your last assessment. We will continue to focus on maintaining your finger strength.

Power endurance

Your score of 190 sec on the 60% hang test (tested @ 56 kg) shows us that you have an excellent level of climbing fitness. This means that you are able to maintain a sustained power output whilst you are climbing.

When we compare this score with your previous score of 90 sec (tested @ 51.3 kg) we can see that you have seen an increase in your power endurance alongside the improvements you have made for your finger strength. Great work! It should be noted that increasing power endurance whilst seeing an improvement in finger strength is a great achievement! As this is currently not a limiting factor to your climbing performance we will aim to maintain this area..

Upper body pulling strength

Your score of 59.6 kg - 120% body mass - on the 2 rep max pull up test shows us that you have an average level of pulling strength.

Compared to your previous score of 66.5 kg (134% body mass) we can see that you have a small decrease in your pulling strength score since your last assessment. It is expected to see a small decrease in pulling strength, since there was a significant focus placed on improving your other physical attributes in your previous training plan. As you are around the expected female gold standard of 135% BW. We will now aim to gradually improve your pulling strength.

Hip flexibility

Your hip flexibility score of 154 cm, 100 % as a percentage of your height - shows that you have above average hip flexibility. For shorter climbers, hip mobility is especially important for efficient climbing movement patterns.

Compared to your previous score of 155 cm (101 % height) we can see that you have . Your score on the hip flexibility test shows us that you have a good range of motion around the hip joint. We will continue to maintain this whilst we focus on the development of other areas of your profile.

Your plan and structuring your week:

Within the Lattice Training app, on the 'Your Plan' tab I have left a personalised overview of the direction and goals of your training plan. Within your training plan, you will also find that I have added specific notes to a number of your training sessions (these are shown in 'Coach Tips' within a session). This will help further fine-tune and tailor your training beyond what is already prescribed in the session sheets.
