

TESTING

REST

Please have at least 48 hrs rest before completing the testing session. It is important that you are not sore or fatigued for the best results.

TIME COMMITMENT

The testing itself should take around 1hr to complete. Please make sure to warm up thoroughly before the session, we recommend at least 30 min of moderate intensity exercise, starting gently and increasing the intensity until you are ready to pull hard. Include pulse raising exercises, a large range of climbing movements and finally ensure that your fingers are ready to fingerboard at a maximum intensity.

EQUIPMENT

You will need:

- Weighing scales (any bathroom scales will be fine).
- A tape measure to record height and hip mobility.
- 20mm hangboard edge (our preferred test edge is the lattice training rung).
- Weights (typically you will need 10-60 kg with increments down to 2.5 kg).
- Pulley setup (pulley and thin flexible rope. A Petzl Partner pulley and 5mm cord is best).

ANTHROPOMETRICS

On the day of the testing please record the following measurements.

1. Height in centimetres. Measure this without shoes on.
2. Ape Index in centimetres. Measure the furthest distance from fingertips on the right hand to fingertips on the left when your arms are spread wide apart. You can do this lying on the floor or against a wall.
3. Body Mass in kg. Use a set of bathroom scales that you know are reliable. All weights should be recorded in kg.

REST BETWEEN EXERCISES

Rest for 10 min between each of the exercises.
