

TWO ARM MAX HANG

Complete progressively harder dead-hangs using your chosen fingerboard until a maximum weight is reached. Each hang must be completed on 2 arms and will last 7 sec in total.

You should aim to reach as max scores between 4-8 attempts of dead hangs after warming up. If your testing session goes wrong and you end up needing more than 8 hangs to find your max, rest 24hrs before trying again. You must maintain the same "half crimp" grip position throughout

Half Crimp Grip

Open Hand Grip

which you completed when your fingers did not change position.

Maximum loading (1 RM @ 7 sec) = Bodyweight + additional weight.
For example: Bodyweight = 70 kg and additional weight = 20 kg.
Therefore, maximum loading for a 7 sec 1 RM is 90 kg.

Record;

- Fingerboard used.
- Depth of hold used (18-20-22 mm edge).
- Total load (kg) (total load refers to the weight in kg added or removed from your body in ADDITION to body mass in kg)).

the test hangs. The first hang should be moderate intensity and each subsequent hang will get harder by increasing the load. It may increase risk of injury if you change grip position during the hangs, therefore if your fingers open up or move under the load or hanging, consider this a failed hang and record the score
