

STRENGTH ENDURANCE 60%

Using 60% of the total load (kg), complete continuous reps of 7 sec on, followed by 3 sec off for as long as you can. Repeat until you reach total failure and record that total time (e.g., 115 sec). Do not lock off throughout and use the same position of 150-180 degrees at the elbow. Failure is deemed as being unable to complete a 7 sec hang during one of the reps. As in the max hang test, if your finger changes position whilst hanging, this is deemed as failure.

60% load used in testing = (Body mass [kg] + max test change in load [kg]) x 0.6.

Example:

70 kg climber completes a max hang with an additional 30 kg.
60% load used in this testing = $(70 \text{ kg} + 30 \text{ kg}) \times 0.6 = 60 \text{ kg}$
This means the climber has 10 kg of assistance using a pulley

Record:

- A. Total time in sec.
- B. Total load (kg) (Total load refers to the weight in kg added or removed from your body in ADDITION to body mass in kg).

RESULTS

Thanks for completing the testing! Once we have received your results, we will put your plan together and email it through to you before the start date you have specified. Please remember to return your results to us via the form linked in the email.
